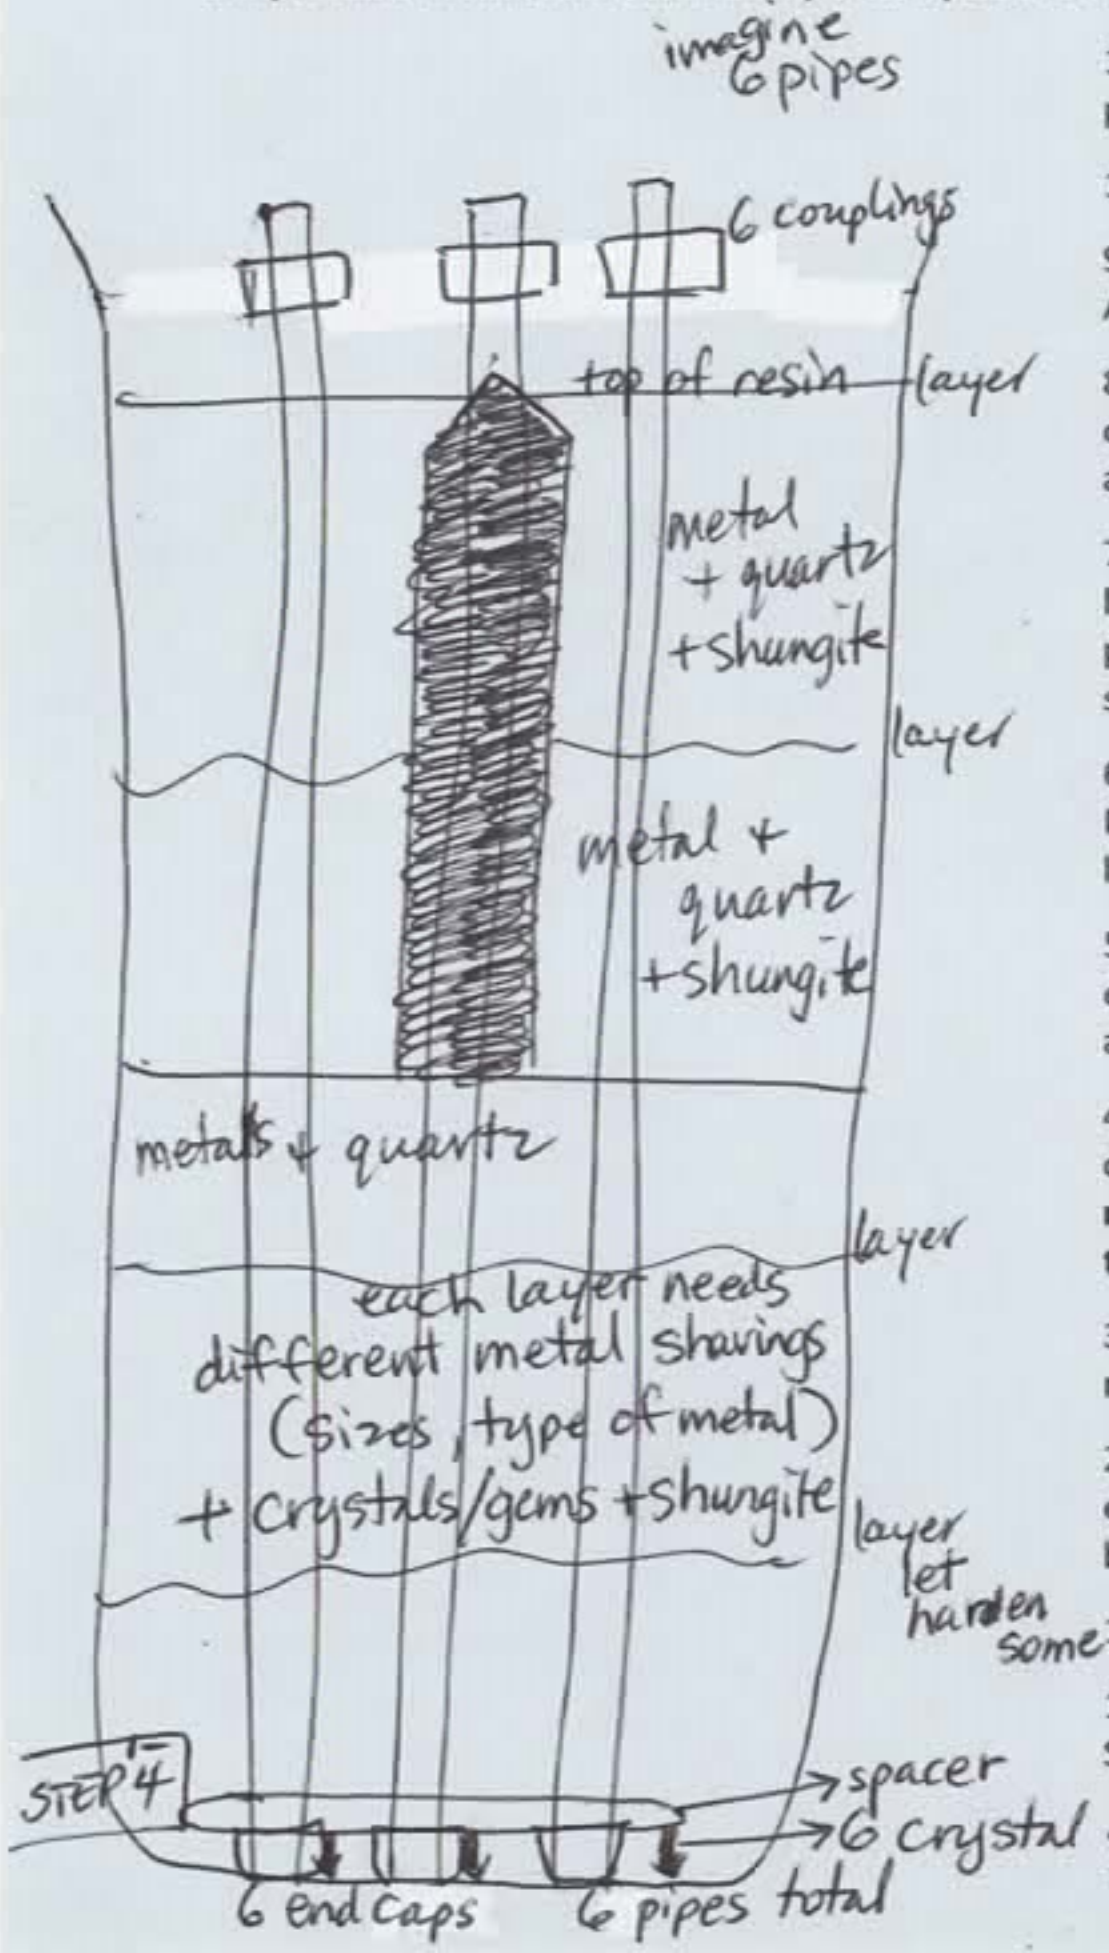
How to Make a Cloud Buster as taught to Carmen by Carol and Don Croft

This process will take more than 1 day to complete. Don't rush, do it layer by layer, and take a break until the resin hardens some. Add crystals throughout.



11. Add couplings and 5 ft. pipes. Use the spacer, with no hole in the middle, to hold the pipes in place.

10. Drop one crystal in each pipe with the points pointing up towards the sky. ↑ You can wrap the point in wire if its too skinny. (or you want to)

9. Pour resin to cover everything except the tip of the chubby crystal point (or cover it if you want). Allow resin to completely harden. Take the top spacer off. You'll need it to keep the 5' pipes in place.

8. Add metal shavings and the rest of the stones until the crystal is mostly covered with just the point of the big crystal sticking up. Remember to put the top spacer so it keeps your pipes from moving at all.

7. Add more metal, crystals+ shungite, and resin. Check how the chunky quartz point is fitting. If it looks like it will be high enough in the bucket (or low enough) then place it in the middle of the 6 pipes and put metal shavings around it to keep it in place. Add more resin and wait for it to harden some.

6. Pour resin to cover these shavings and crystals (it's okay for metal not to be all covered with resin). Measure how your chunky quartz point fits in the bucket so you know when to place it so the tip is at least 1 inch lower than the top of your bucket. Wait until the resin hardens some.

5. Add 2 inches more of metal shavings . Divide the rest of your crystals and shungite so you have enough to use throughout 3-4 more layers. Add some quartz crystals (and other crystals you chose) and shungite throughout.

4. Pour resin to cover the bottom spacer. Add some more metal so you don't see the resin. Put the other spacer on the top of the pipes to hold everything in place until the resin hardens some. **You'll need to remove the top spacer every time you add more metal, crystals, and resin. Then put it back to keep the pipes in place.**

3. Put a small crystal point near each of the 6 pipes pointing down (I put them in the metal shavings moving my hand around the outside of the bottom spacer). ↓

2. Put pipes through the spacer that has a hole in the middle. Push until the spacer touches the endcaps. Put these now through the metal shavings, and wiggle them in until the endcaps touch the bottom of the bucket. Add more metal if you need to so it's all around the spacer.

1b. Use silicone to glue on the copper endcaps to the copper pipes.

1a. In a 2 gallon bucket, put 1 inch of metal shavings (mix of different sizes, shapes, and metals). Sprinkle in needle/tiny quartz points if you want.
